

Backend engineer with 5+ years of experience designing high-scale, event-driven systems processing tens of millions of events per day. Proven track record in platform strategy, owning CI/CD infrastructure for 40 engineers, and leading teams through performance cycles. Skilled in systems architecture, technical direction-setting, and building reliable backend platforms using Python, Go, Kafka, and AWS services.

Senior Backend Engineer | Northwind Logistics | 2021-2026

- Architected and shipped an event-driven order pipeline on AWS Lambda and EventBridge processing 40 million events per day, establishing the backend technical direction for order fulfillment systems
- Reduced p99 latency from 900ms to 120ms by redesigning synchronous fan-out into an asynchronous SQS buffer architecture, demonstrating high-scale systems design
- Owned the company-wide CI/CD platform strategy for 40 engineers: GitHub Actions on autoscaling EC2 with shared caching, cutting mean build time from 11 minutes to 4 minutes
- Introduced Apache Kafka as the backbone for cross-team data exchange--14 topics with schema-registry-enforced Avro contracts and consumer-lag alerting in Datadog--defining the architectural roadmap for platform-wide event streaming
- Led a team of 5 engineers through two performance cycles; rebuilt on-call rotation reducing weekly pages from 6 to approximately 1, improving operational reliability
- Authored Terraform modules and blue/green deploy pipeline for billing service migration to ECS Fargate, plus rollback runbook used by on-call team--setting engineering standards across the organization

Technical Skills

- Languages: Python, Go
- Infrastructure & Cloud: AWS (Lambda, EventBridge, SQS, ECS Fargate, EC2), Terraform, Docker, Kubernetes
- Data & Messaging: Apache Kafka, Avro/Schema Registry, PostgreSQL, Redis
- Observability & CI/CD: Datadog, GitHub Actions, blue/green deployments
- Architecture Patterns: Event-driven systems, microservices, asynchronous processing, high-scale backend systems
