

Senior Backend Engineer with 5 years of experience designing high-throughput distributed systems, leading engineering teams, and owning critical infrastructure. Proven ability to ship production services processing tens of millions of events daily while driving down latency and operational burden. Strong foundation in event-driven architecture, CI/CD ownership, and cross-team platform work.

Senior Backend Engineer -- Northwind Logistics (2021-2026)

- Designed and shipped an event-driven order pipeline on AWS Lambda and EventBridge processing 40 million events per day; cut p99 latency from 900 ms to 120 ms by replacing synchronous fan-out with an SQS buffer
- Owned the CI/CD platform for 40 engineers: GitHub Actions runners on autoscaling EC2 with a shared caching layer that reduced mean build time from 11 minutes to 4 minutes
- Wrote Terraform modules and blue/green deploy pipeline for billing service migration onto ECS Fargate, plus the rollback runbook still used by the on-call team
- Led a team of five engineers through two performance cycles; rebuilt on-call rotation reducing pages from six per week to roughly one per week
- Introduced Apache Kafka as backbone for cross-team data exchange: 14 topics with schema-registry-enforced Avro contracts and consumer-lag alerting in Datadog

Technical Skills

- Languages: Python, Go
- Infrastructure: AWS (Lambda, EventBridge, SQS, ECS Fargate, EC2), Terraform, Docker, Kubernetes, GitHub Actions
- Data & Messaging: Apache Kafka, Avro, PostgreSQL, Redis, Datadog
